

IAW LOGIC-LOCKED RAIL

Institutional PaaS Specifications

VERSION 2.1 | MAY 2026

Derek Benjamin Little *Founder & CEO, Innovative App World LLC*

CORE UTILITY: Non-Custodial Infrastructure, Account-Level State Locking, and Automated Revenue Logic

REGULATORY ALIGNMENT:

- **UAE:** VARA / DIFC Standards
 - **EU:** MiCA Compliance
 - **USA:** Clarity for Payment Stablecoins Act
 - **GLOBAL:** BIS Cross-Border Settlement Frameworks
-

1. Executive Summary

The **IAW Logic-Locked Rail** is a multi-chain Protocol-as-a-Service (PaaS) mainframe engineered for high-velocity institutional tokenization. By utilizing **Xahau Hooks**, the protocol enforces compliance and treasury routing at the ledger level through mathematical state-locking, eliminating the need for custody of user assets. This framework anchors digital value 1:1 with **RLUSD**, providing a transparent engine for global commerce that removes counterparty risk.

2. Global Regulatory Alignment

The multi-chain IAW Logic-Locked Rail is engineered to operate within the emerging frameworks of the world's leading financial hubs:

- **UAE (VARA/DIFC):** Aligns with Dubai's progressive virtual asset regulations for institutional-grade digital asset infrastructure.
- **European Union (MiCA):** Supports the strict reserve and transparency requirements for asset-referenced tokens and e-money tokens.
- **United States (Clarity for Payment Stablecoins Act):** Engineered to meet the high standards for dollar-backed payment rails and non-custodial software utilities.
- **BIS Standards:** Incorporates the Bank for International Settlements (BIS) recommendations for cross-border stablecoin flows, prioritizing 1:1 parity and liquidity stability.

3. Non-Custodial Utility

- **User Sovereignty:** All private keys, issued tokens, and underlying collateral remain under the sole control of the user; IAW never has access to user credentials.
- **Infrastructure Hosting:** The protocol utilizes **XRPTokenizer.com** solely for cryptographic verification and Hook hosting to ensure network-wide integrity.
- **JIT (Just-In-Time) Minting:** Branded tokens are minted directly within the user's account only after the Hook verifies a 1:1 state-lock of **RLUSD**.
- **404 Liquidity Alignment:** The protocol supports semi-fungible token standards, enabling seamless fractionalization of Real-World Assets (RWAs) while maintaining high-velocity liquidity within the logic-locked framework.

4. The "Toll-Keeper" Revenue Engine

- **0.33% Integrity Fee:** Every transaction processed through the IAW logic triggers a fixed 0.33% infrastructure fee.
- **Automated Routing:** Using 64-bit precision logic, the Hook instantly routes these fees to the **IAWCENTRALHUB** (Revenue Vault) and designated distribution slots.
- **Risk Isolation:** Operational revenue is decoupled from issuance logic for a clean, institutional-grade audit trail.

5. Institutional Parity & Safety

- **RLUSD Anchor:** Stability is maintained through a 1:1 tether to NYDFS-regulated RLUSD.
- **Asset Restitution (Flag 64):** Mandates **tfMPTCanClawback** for asset recovery in cases of lost keys or regulatory mandates.
- **SEC Compliance:** Aligns with **Rule 17a-4** standards for digital asset data retention.

6. Conclusion

The **IAW Logic-Locked Rail** is the definitive bridge between traditional financial rigor and decentralized efficiency. Through protocol-enforced compliance and an automated revenue engine, **Innovative App World LLC** provides the infrastructure required for the next generation of global finance.
